

Boé Medical Center

Located in Boé, the medical center is part of a recent initiative aimed at strengthening healthcare services in the region. Opened in 2026, this healthcare facility was designed to provide a functional, calming, and sustainable environment tailored to the needs of both healthcare professionals and patients. For this project, 500 m² of Sarlon trafic 19 dB flooring was installed throughout the facility's various spaces. Its sound attenuation capacity of 19 dB significantly reduces noise pollution, helping to create a calm and serene atmosphere for both patients and staff. Particularly suited for high-traffic areas, Sarlon Trafic ensures the long-term durability of installations. Its surface also offers optimal ease of maintenance, meeting the strict hygiene requirements specific to healthcare facilities. The choice of the green shaped wood finish also adds a warm and natural aesthetic touch. Its green hue, combined with a wood-inspired pattern, helps create a soothing and welcoming environment that aligns with the facility's focus on well-being.
