

Energiebunker Hamburg-Wilhelmsburg

This monument has been converted so as to become an energy efficient symbol of climate protection. With its solar arrays on the roof and the south façade, the building is identifiable from afar as the "energy bunker". The exhibition tells the eventful story of the bunker from its construction in 1943 to its refurbishment and realization as an IBA project. They used floor Marmoleum Real 3139 and Walton Crocodiles C169 for the wall
