FLOORING SYSTEMS

creating better environments

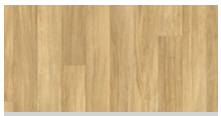

Jönköping Airport

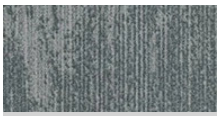

When the lounge and conference areas at Jönköping Airport were refurbished, the goal was to create a more welcoming and refined interior. The spaces are characterised by large panoramic windows and strong connections to the surrounding landscape, making it important to choose a flooring solution that complemented the natural setting while meeting demanding functional requirements. Flotex was selected for its unique combination of performance and aesthetics. Combining the comfort and acoustic benefits of a textile floor with the durability and ease of maintenance associated with resilient flooring, it offered a practical solution for a busy public environment. Reducing noise levels was a key requirement for the project. In areas where passengers work, meet or wait before travelling, Flotex helps create a quieter and more comfortable atmosphere. At the same time, its dense flocked construction makes it easy to clean and well suited to environments with frequent daily use and high expectations for maintenance. Design was also an important consideration. The chosen floor contributed to the premium look and feel sought for the space, while supporting the overall interior concept and enhancing the connection between the building and its surroundings. The combination of acoustic performance, comfort, cleanability and design flexibility made Flotex a suitable choice for the project. The result is a lounge and conference environment that offers an improved experience for both staff and visitors. According to Jönköping Airport, the installation has helped enhance the overall impression of the facilities while meeting the practical requirements of a modern airport environment.
