

Montreal Airport

The redesign of the airport gates for Aéroport de Montréal required a resilient textile floor covering that was easy to maintain, environmentally friendly and offered good indoor air quality. The floor should have a modern look with lots of movement in the design and installation. Flotex flocked flooring was the ideal solution. The Flotex planks are specially made for this project using Forbo's digital printing technique. With its smooth, velour like surface that looks and feels like a carpet, Flotex is the perfect textile substrate for vibrant designs and true to life visuals. The Flotex solution fitted in well with the Forbo Marmoleum that was already in place.
