

Sapporo Hakuyokai Hospital

Relocation and renovation of a hospital located in a cold, snowy region. The following requirements needed to be met for the selected flooring material: • Non-slip (slip resistance) • Durability and dryness to withstand snow • Infection control • Fall protection (cushioning) • Easy maintenance • Designer's intention (A sophisticated design that does not give the impression of a heavy hospital) The entrance features three snow removal rooms that prevent snow and dirt from entering, with entrance mats laid out in stages. From the first-floor outpatient lobby to the curved corridors on each floor, the precise dimensional stability of Flotex ensured the flooring was installed exactly as envisioned. It also functions seamlessly in high-traffic areas, maintaining its design integrity while ensuring thorough maintenance.
