# FRAYFREE

## SAFER UNSEALED BELT EDGES

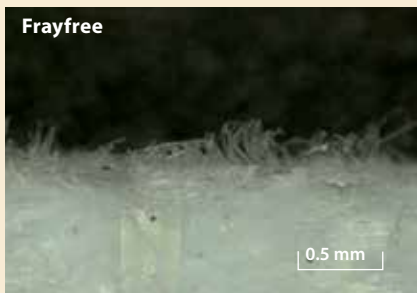

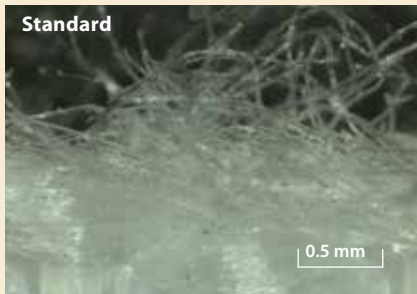

**Frayfree is the new belt design that keeps fraying belt edges to a minimum.**

The stability of the fabric on the belt edge is influenced significantly by many factors. In the Frayfree belt types, the combination of various steps substantially reduces the tendency of the belt to fray.

A special type of fabric, a special weave and an enhanced filament length improve the grip of the filaments in the fabric composite. Advanced production technology also ensures reliable bonding of the individual fabric filaments to the coating material.

Frayfree belt types are particularly suitable for conveying packaged and unpackaged food, e.g. confectionery and baked goods and support you in implementing your HACCP concept.

Belt edges after the impact of a defined force.

### The properties

### The advantages

no fluff forms on the belt edge	▶	no contamination of goods conveyed
belt edges resistant to mechanical stress	▶	long service lives
flexible belt design	▶	suitable for rolling and fixed knife edges
wide range of types	▶	wide range of applications
FDA/EU-compliant, Halal certified	▶	world wide authorisation for direct contact with food
