

326 uv-careshield

FOR FAST PROTECTION

A large part of our daily lives takes place on floors. Floors usually have to tolerate a lot of use. That's why many floors have a strong and durable protective top layer specially developed for intensive use. Forbo Eurocol has developed 326 UV-CareShield to restore floors that need freshening up after years of use or floors that have become damaged. UV-CareShield is an innovative protective layer that makes floors look brand-new again with optimal protection.

HOW DOES **UV-CARESHIELD** WORK?

Linoleum comes with a factory-applied finishing layer as standard and requires no further treatment. These floors can be kept looking their best with frequent dry cleaning. This is best done with a good dust mop or adhesive wipe. This removes all loose dirt, after which stains can be removed with a damp (flat) mop.

Many older linoleum floors were provided with additional polymer layers in the past that were applied during maintenance. Even today, many cleaning companies still work with polymers to give floors a beautiful finish again. In practice, this often means floors have several polymer layers because the operation was performed repeatedly. All of these polymer layers don't make the floor better or more beautiful. Differences in gloss, tracks and dirt accumulate unnoticed between the many polymer layers. In these situations, UV-CareShield is the ideal solution. Once the polymer layers have been removed by chemical or mechanical cleaning, the floor

has actually been returned to its original state. If you then apply the new UV-CareShield instead of a polymer layer, the floor is protected with a UV-cured finish that has the same result as the original factory finish and your floor becomes like new again.

The UV-CareShield floor care process is fast and efficient, meaning the floor can be used again quickly after applying the new finish. Thanks to the huge time savings compared to other systems, this treatment is highly suitable for areas that need to be used again immediately, e.g. healthcare, shops and airports.

Damaged floors

UV-CareShield is also the right solution for damaged floors. Damage can occur in the course of using the floor, but it's even more annoying when it already happens during installation or before the building is put into use. All cases of damage to the top layer of floors can be treated quickly and efficiently

with UV-CareShield, after which the floor performs like a brand-new floor again.

Professional companies must be used to remove the old layers and apply the UV-CareShield.

The advantages of UV-CareShield are:

- Permanent heavy-duty coating that facilitates regular maintenance
- Suitable for any linoleum floor, regardless of the ex-factory top layer or maintenance product used
- After treatment, the linoleum floor is in perfect condition again
- Due to rapid protection, the room can be used again immediately after treatment
- Durable floor protection against dirt and stains, including disinfectants
- Easy to clean
- Beautiful matt and glossy appearance
