Layout
Impressa® Modular flooring products are fit using conventional tile fitting techniques.

It is customary to start from the center of the room. In corridors and small spaces, it may be simpler to work lengthwise from one end, using the center line as a guide.

The center line is drawn as follows (Figure 1): A chalk line is snapped from center of wall A/B (Point E) to the center of wall C/D (Point F). The center of line E/F is found (Point M). Draw a perpendicular line through Point M using the 3:4:5 method to establish G/H.

Starting at Point M, measure out lengthwise and widthwise to the walls to make sure you will have at least a half of a tile at the border. Adjust lines E/F and G/H if necessary.
Installing Impressa® Modular Flooring

Always refer to and follow the recommendations in the Forbo General Installation Guidelines prior to installing Impressa® Modular flooring.

Always refer to and follow the recommendations in the Forbo Substrate Evaluation and Preparation prior to installing Impressa® Modular flooring.

Beginning the installation is an implied acceptance of site conditions and liability for any failure directly related to inadequate site conditions becomes the responsibility of the installer and/or flooring contractor.

Impressa® Modular flooring may be installed on approved substrates on all grade levels.

Store Impressa® Modular cartons unopened.

Use Forbo T 940, Sustain 885m, Sustain 1195, Sustain 1299 or 660 adhesive. Forbo Sustain 1299 is NOT suitable for all installations. Refer to the Forbo Sustain 1299 technical data sheet for more information and contact Forbo’s Product Support & Education Services before installing with these adhesives.

Use a 1/16” x 1/16” x 1/16” square notch trowel to apply the adhesive. Replace the trowel blade when proper coverage is no longer attainable.

Use material from the same batch/dye lot.

Do not remove more tile from the carton than can be installed in approximately 1 hour.

Install cartons in consecutive order.

Impressa® Modular is available in 10” x 40” (25cm x 100cm) and can be installed in any direction. The tolerance in the sequence of carton numbers should not exceed 100.

To avoid shading throughout the installation, it is recommended to shuffle tiles from several cartons.

Do not allow heavy traffic or rolling loads for a minimum of 72 hours following the installation. For installations over non-porous substrates, additional time may be necessary because the adhesive may take longer to cure.

Wait a minimum of five days following the installation before conducting initial cleaning. For installations over non-porous substrates, additional time may be necessary because the adhesive may take longer to dry and cure.

Take pride in your work and be Professional at all times.

Installation

After establishing the starting lines, spread the adhesive using a 1/16” x 1/16” x 1/16” square notch trowel.

Be sure to spread adhesive all the way to the starting line without leaving any voids.

Begin laying tiles at the starting point, ensuring that the tile is placed exactly along the layout lines. If the first few tiles are not installed accurately, the entire installation will be affected.

The tiles must be installed into wet adhesive. Do not spread adhesive in an area larger than can be installed while ensuring 100% wet transfer to the backing of the material.

The open time and working time of adhesives will vary depending on site conditions such as ambient temperature and humidity, the porosity of the substrate and air circulation. It is the installer’s responsibility to make adjustments to specific conditions as may be necessary to ensure 100% wet adhesive transfer to the material backing. A general indication of proper open time is when a light touch produces transfer of adhesive to the finger, but a firm touch will flatten and “smear” the adhesive. For additional information, refer to the Forbo Adhesives Guidelines.

A short open time will be necessary. The adhesive should be allowed to develop body before placing the flooring material into the adhesive, but DO NOT ALLOW THE ADHESIVE TO DRY.

Check for adhesive transfer frequently. There must be 100% wet transfer of adhesive to the material backing in order to achieve a secure bond. 100% wet transfer is a continuous film of adhesive, when wet, on both the backing of the material and the substrate with no trace of trowel marks or ridges. The flooring material must remain in contact with the adhesive while the adhesive is drying and curing.

Immediately roll the flooring in all directions using a 100 lb. roller to ensure proper adhesive transfer. Additional rolling is required during adhesive setup to ensure that the material is flat and fully adhered.

The use of a three-section wall roller or steel seam roller is required at walls, under toe kicks or anywhere the full weight of a 100 lb. roller cannot access or be applied.

Proper tile placement and rolling will result in a complete “explosion” of the trowel ridges, creating a continuous flat film of adhesive. Complete transfer of the tile backing will appear as only the impression of the tile backing in the surface of the adhesive. No standing trowel ridges should be visible.
• The time it takes to mark and cut the border tiles must be considered when planning the installation. Without adequate planning, the working time of the adhesive around the perimeter may be exceeded before the tiles are installed. This will result in an inadequate bond of the perimeter tiles. Always plan the sequence of spreading adhesive so that the perimeter tiles can be cut and placed into the adhesive before the adhesive working time has been exceeded.

• Remove fresh adhesive residue immediately with a clean white cloth. Dried adhesive can be removed with a clean white cloth and Forbo Adhesive Remover. If this is not available, a solution of properly diluted neutral pH cleaner may be used. The area should then be rinsed with clean, cool water to remove all residues from the floor.

  **NOTE:** If using Forbo 660 adhesive, refer to the *Forbo Adhesives Guidelines* for additional information.

**Tile Edge Curl**

Tile edge curl is often indicative of an installation failure. Impressa® Modular flooring products are an all-natural wood-based product. Like other wood-based flooring products, improperly installed Impressa® can be affected by extreme changes in the ambient relative humidity. When exposed to excessively low ambient relative humidity, the edges of tiles which are **NOT FULLY BONDED** may exhibit a tendency to curl along one or both length edges. This is an INSTALLATION FAILURE, not a material defect. This installation failure is avoided by following the installation recommendations and by properly using the recommended Forbo adhesive.

Impressa® Modular flooring products that are set into wet adhesive and thoroughly rolled in all directions with repeated rolling during the course of the installation will achieve proper transfer to the substrate and remain flat and fully bonded. Curled edges will lay completely flat and will be well bonded. Proper tile placement and rolling will result in a complete “explosion” of the trowel ridges, creating a continuous flat film of adhesive. Complete transfer of the tile backing will appear in the surface of the adhesive. NO trowel ridges should be evident.
